

Cloudflare Outage 2025

How One File Took Down 16% of the Internet

Geeks Club

 December 10, 2025

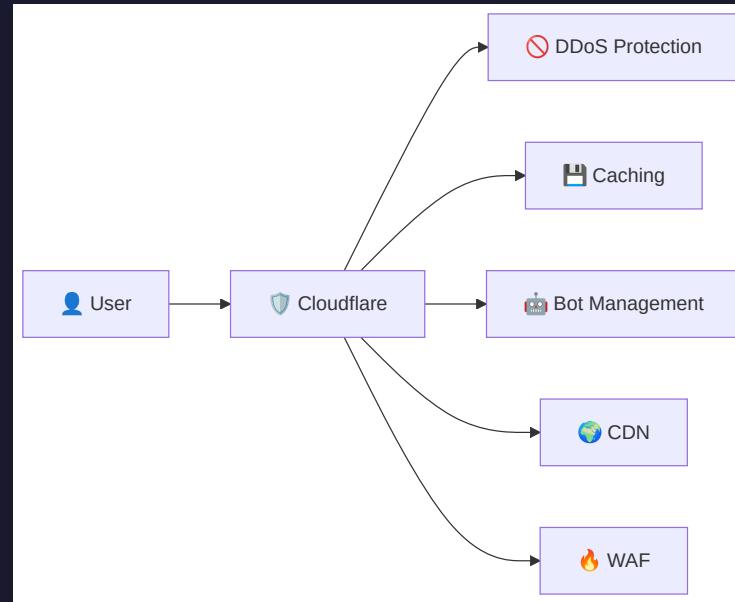

Agenda

1.  **Why is Cloudflare important?**
2.  **What happened?** - Outage Timeline
3.  **Technical Analysis** - ClickHouse, Rust, unwrap()
4.  **Confusing Factors** - Why they thought it was a DDoS attack
5.  **Conclusions and Remedial Actions**
6.  **Comment** - What do we learn from this?

🌐 What is Cloudflare?

Middleware between the client and your application

Cloudflare Scale

~16% of all internet traffic A small green globe icon.

| Every sixth request on the internet goes through Cloudflare

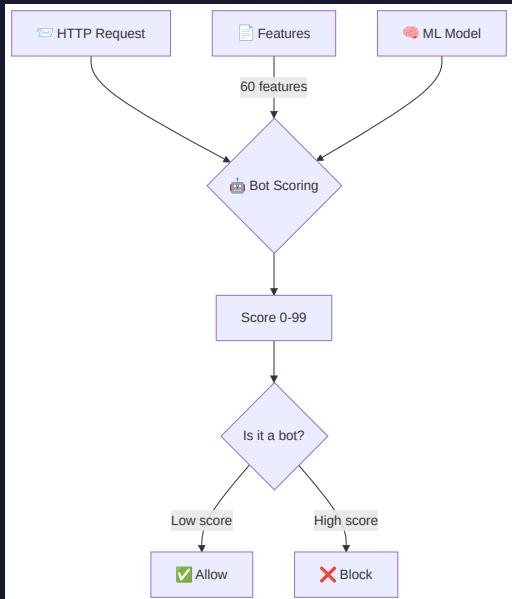

Known users:

Category	Companies
Technology	Mozilla, Microsoft Azure, Office 365, IBM
E-commerce	Nike, H&M, Shopify
Social	Reddit, Twitter

Bot Management - Source of the Problem

How does bot scoring work?

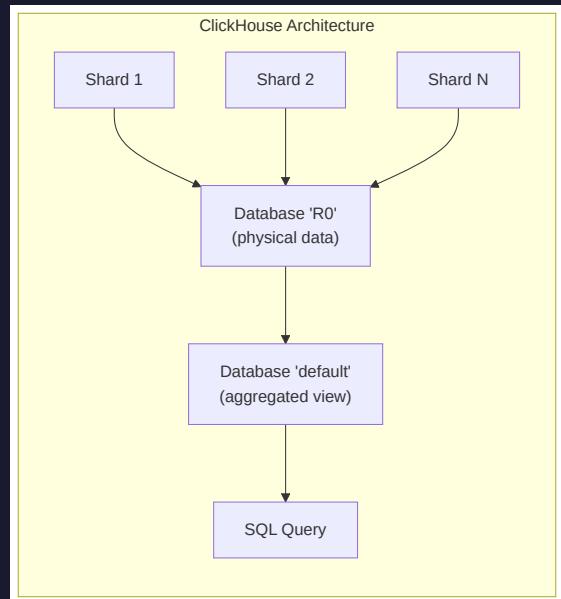

Bot Score: 0-99 (higher = greater bot probability)

ClickHouse Architecture

Databases and shards

🔍 Query without database discriminator

```
SELECT
    name,
    type
FROM system.columns
WHERE
    table = 'http_requests_features'
ORDER BY name;
```

⚠ Problem:

- No `WHERE database = 'default'`
- After permission change → both databases visible
- **60 features × 2 = 120+ features**

Rust and fatal `unwrap()`

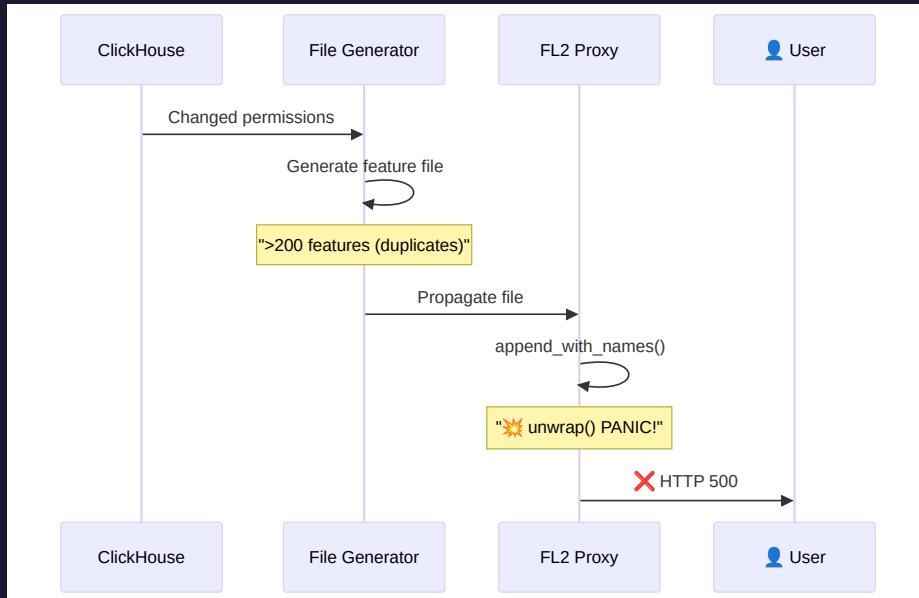

```
// Simplified code that caused panic
fn load_features(config: &Config) -> Features {
    let features = append_with_names(&config)
        .unwrap(); // ⚡ BOOM!

    features
}
```

Memory preallocation problem:

- **Limit:** 200 features (safety buffer)
- **Expected:** ~60 features
- **Received:** >200 features (duplicates)
- **Result:** `Result::unwrap()` on `Err` → **PANIC** 💀

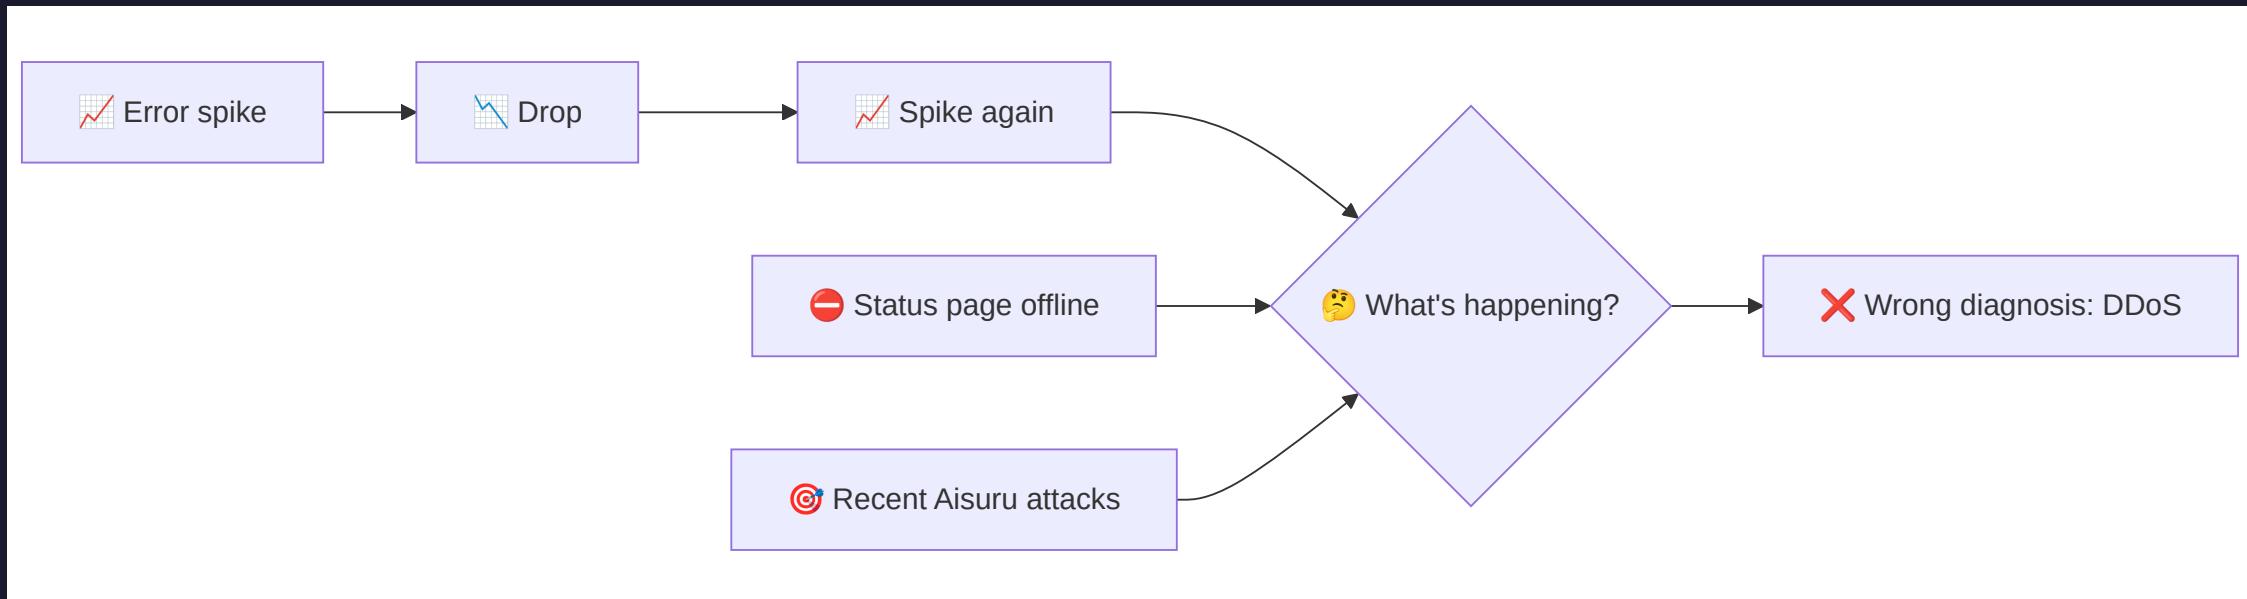

💥 Outage Mechanism

Confusing Factors

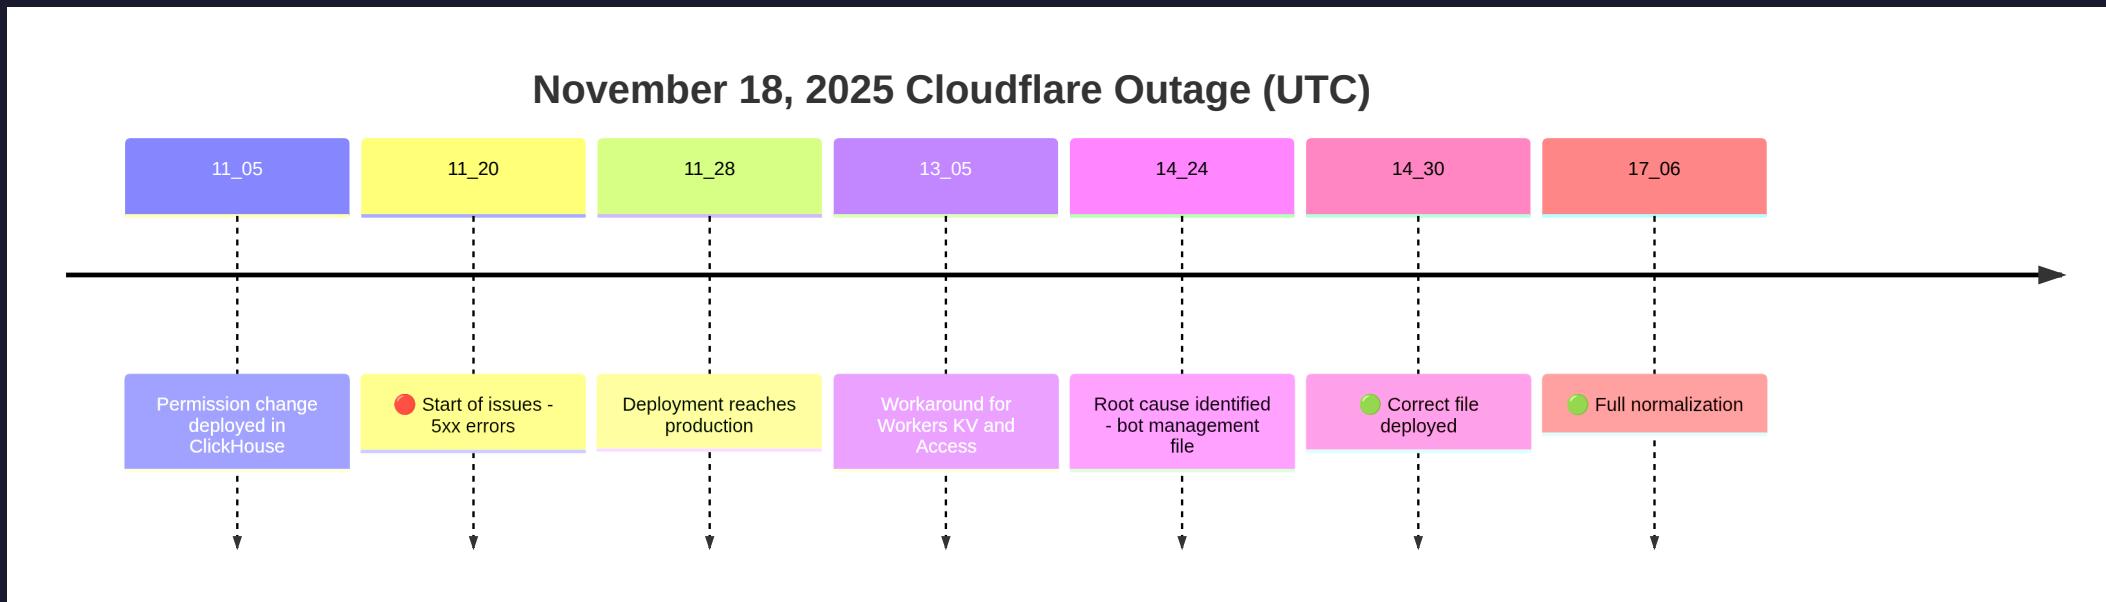

Why did they think it was a DDoS attack?

Unusual behavior:

- Fluctuations: old nodes had correct cache
- Status page (independent infra) also offline → **coincidence!**

⌚ Outage Timeline

Cloudflare Remedial Actions

Official list:

1. **Hardening** of internal configuration (like user data)
2. **Kill-switches** - global function switches
3. **Core dumps** - cannot overload the system
4. **Review failure modes** of all proxy modules

"Today's outage was the most serious incident since 2019"

— Matthew Prince, CEO

Our Technical Conclusions

What could have been done better?

```
let features = append_with_names(&config).unwrap_or_default();
if features.len() > 200 {
    log::warn!("Retrieved {} features, exceeded limit 200.", features.len());
    features.truncate(200);
}
// ✓ Continue with features
```

Instead of:

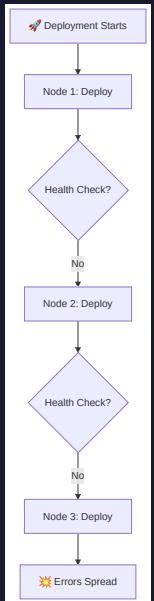

```
.unwrap() // ✗ PANIC!
```

Should be:

```
.unwrap_or_else(|e| { log::error!("{}", e); defaults() })
```

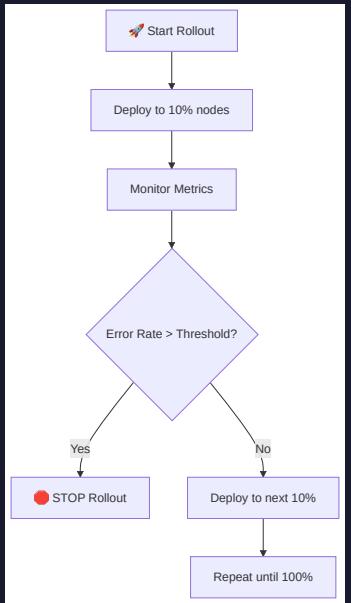

Preventing Deployment Spread: Circuit Breakers and Rollout Strategies

Why did the update keep spreading?

Automated rollouts without real-time monitoring → Errors propagate unchecked

Circuit Breaker Pattern for Deployments

Stop propagation if errors exceed safe limits

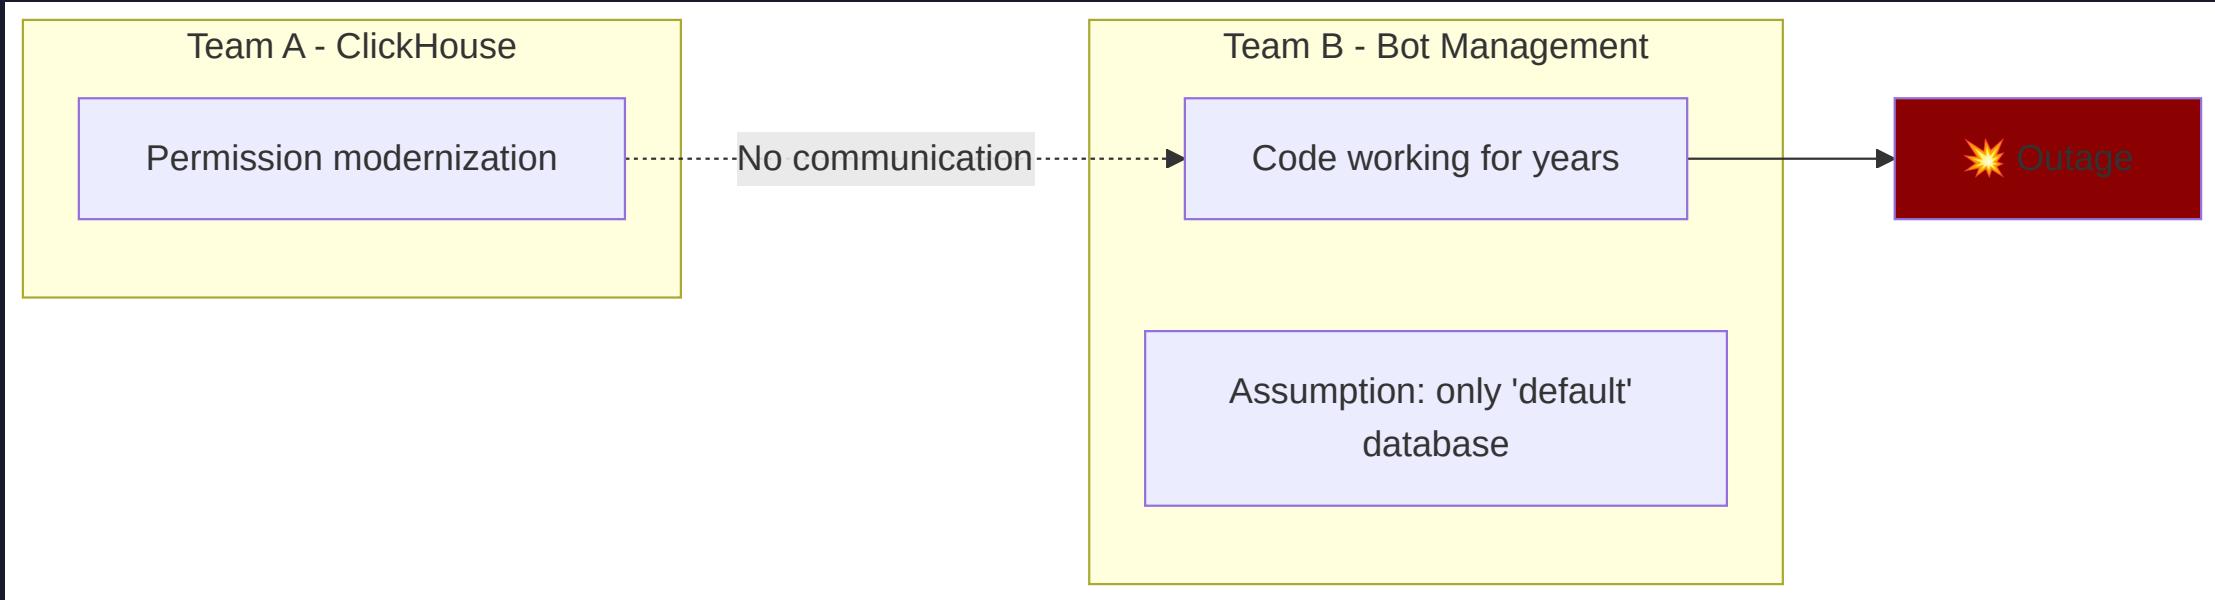

Different Strategies for Different Changes

Change Type	Strategy	Speed vs Safety
 Security Patches	Fast rollout	 Speed (counter attacks)
 Infrastructure Changes	Canary / Blue-Green	 Safety (rollback ready)

Balance speed for security with caution for infra

Organizational Problem

🎯 Key problem:

Change in one place → explosion in another

What about the test environment?

Possible explanation:

Production scale ≠ Test scale

Key Lessons

1 Defensive Programming

| Never trust that inputs will be correct

2 Graceful Degradation

| System should work limited, not crash

3 Inter-team Communication

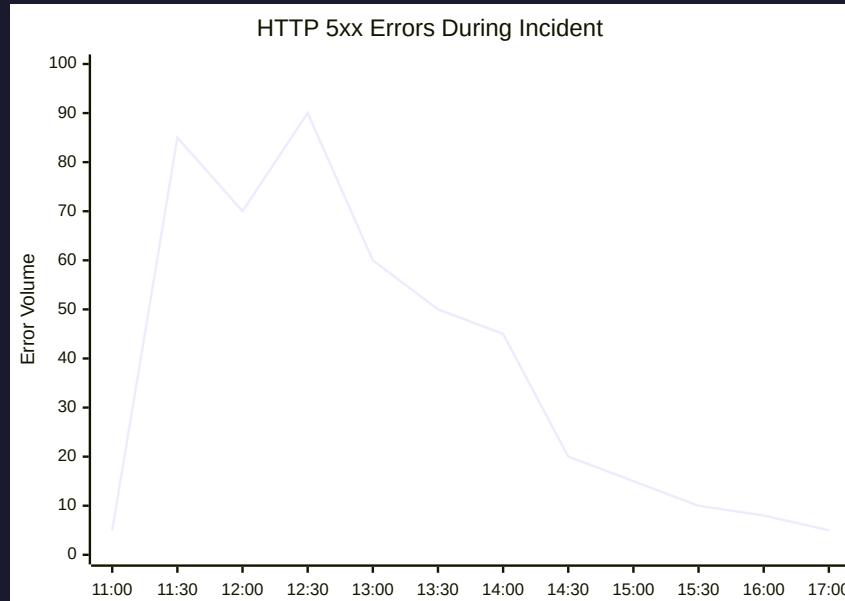

| Changes in one system can affect others

4 Production-scale Testing

| Pre-prod must reflect reality

Outage Visualization

Fluctuations = different nodes with different feature file versions

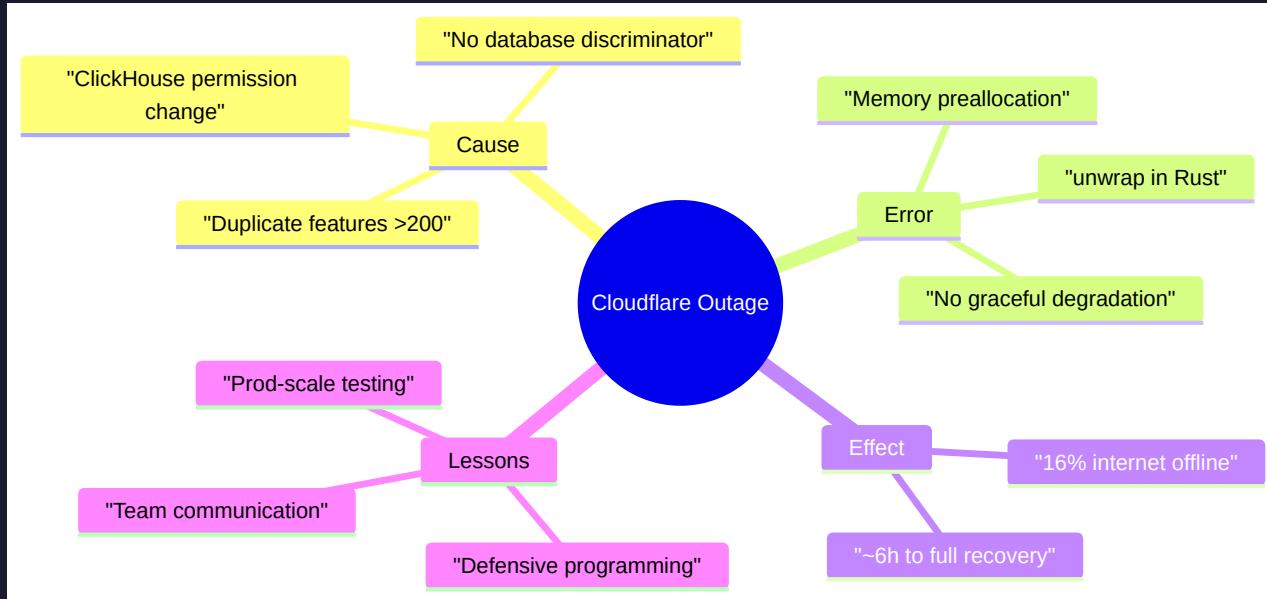

For Discussion

Questions for the team:

1. 🔎 **Do we have similar "hidden dependencies" in our systems?**
2. 🦀 **How do we handle errors** in critical code paths?
3. 📊 **Do our test environments** reflect production scale?
4. 💡 **How quickly will we detect** an outage before users?
5. 📝 **Do we do post-mortems** and are they public?
